

Spring Core Exercise 8: Maven Multi Module Setup

Exercise 8: Implementing Basic AOP with Spring

Scenario:

The library management application requires basic AOP functionality to separate cross-cutting concerns like logging and transaction management.

Steps:

Define an Aspect:

Create a package `com.library.aspect` and add a class `LoggingAspect`.

Create Advice Methods:

Define advice methods in `LoggingAspect` for logging before and after method execution.

Configure the Aspect:

Update `applicationContext.xml` to register the aspect and enable AspectJ auto-proxying.

Test the Aspect:

Run the `LibraryManagementApplication` main class to verify the AOP functionality.
