

Solution Code - React - Form_Validation_Mail_Register

Below is the complete functional source code implementation for this assignment. All logic, validation rules, and structural requirements have been satisfied.

Source File: src\App.js

```
1 | import React, { useState } from 'react';
2 |
3 | export default function App() {
4 |   const [email, setEmail] = useState('');
5 |   const [error, setError] = useState('');
6 |
7 |   const handleSubmit = (e) => {
8 |     e.preventDefault();
9 |     if (!email.includes('@')) {
10 |       setError('Invalid email address');
11 |     } else {
12 |       setError('');
13 |       alert('Registered successfully!');
14 |     }
15 |   };
16 |
17 |   return (
18 |     <div style={{ padding: '20px' }}>
19 |       <form onSubmit={handleSubmit}>
20 |         <input value={email} onChange={(e) => setEmail(e.target.value)} placeholder="Enter email"
21 |         />
22 |         <button type="submit">Register</button>
23 |       </form>
24 |       {error && <p style={{ color: 'red' }}>{error}</p>}
25 |     </div>
26 |   );
27 | }
```
